

主 题:	ICASSP2025 : Paper 7388	
发件人:	"Microsoft CMT" <email@msr-cmt.org>	2024-11-12 11:02:36
收件人:	"Shihong Duan" <duansh@ustb.edu.cn>	

Shihong Duan has uploaded review for ROBUST DEEP LEARNING BASED RESIDENTIAL OCCUPANCY DETECTION WITH WIFI

-- Review Summary --

1. How confident are you in your evaluation of this paper?

2. Confident
2. Importance/Relevance

3. Of sufficient interest
3. Classify the type of paper

More empirical
4. Originality/Novelty

2. Minor originality; provides barely sufficient new insight or understanding
5. Justification of Originality/Novelty Score (required)

The dataset collected in the paper is valuable, but the method lacks innovation.
6. Theoretical Development

3. Probably correct; provides limited new insights or understanding
7. Experimental Validation

3. Limited but convincing
8. Clarity of Presentation

3. Clear enough
9. Reference to Prior Work

3. References adequate
10. Overall evaluation of this paper

2. Marginal reject
11. Justification of Overall evaluation of this paper (required)

1. The paper collected data from 7 different households, but the dataset size is still relatively small. It is recommended to increase the diversity of the dataset, such as collecting data from more varied types of houses and under different occupancy scenarios involving varying numbers of occupants.
2.The method description in the paper is brief and lacks critical explanations for each module. For instance, there is no detailed rationale for the choice of the specific CNN architecture, while Transformer blocks are typically used to process sequential data, but the feature maps in this paper are not strictly sequential. It is suggested that the authors elaborate on the advantages and disadvantages of using Transformers in this context, as well as the basis for choosing the number of layers in the MLP Head.
3.In Figure 1, arrows are used to indicate the direction of data flow, but there is no explicit labeling of the input and output data types for each step.
4.Baseline Methods: The experiment only compares with one model-based method. It would be beneficial to include comparisons with other solutions to similar problems, or to strengthen the theoretical and principled analysis and explanations.
5.Do the results in Table 1 indicate that the model still has limitations regarding environmental diversity?
6.A significant part of the high false alarm rate is due to interference from neighbors, so it is necessary to provide a more detailed analysis of the false alarms and propose methods to address this issue.
12. Award Quality (only for papers marked "Definite accept")

0: Not award quality
13. Confidential Comments to technical program committee (will not be seen by authors):

The applicability of the problem addressed by the paper in various scenarios requires further discussion. The data collection is valuable, but it needs to be expanded to support the effectiveness of data-driven algorithms. The method proposed in the paper is relatively simple, and its value would be better demonstrated if it could be validated in different real-world environments.
14. All reviewers must accept and agree to follow IEEE Policies. By submitting your review, you acknowledge that you have read and agree to IEEE's Privacy Policy (<https://www.ieee.org/security-privacy.html>).
