Shihong Duan has uploaded review for Meta-Analogy Learning Based on Dynamic Graph Neural Networks for Inductive Knowledge Graph Link Prediction

-- Review Summary --

1. How confident are you in your evaluation of this paper?

2. Confident
2. Importance/Relevance

3. Of sufficient interest
3. Classify the type of paper

More empirical
4. Originality/Novelty

3. Moderately original; provides limited new insights or understanding
5. Justification of Originality/Novelty Score (required)

The innovation of the paper lies in combining multi-level analogy reasoning with dynamic graph neural networks, using meta-learning to enhance the model's inductive reasoning capability in disconnected knowledge graphs, making it suitable for link prediction tasks under few-shot conditions. The method is supported by data.
6. Theoretical Development

3. Probably correct; provides limited new insights or understanding
7. Experimental Validation

3. Limited but convincing
8. Clarity of Presentation

3. Clear enough
9. Reference to Prior Work

3. References adequate
10. Overall evaluation of this paper

3. Marginal accept
11. Justification of Overall evaluation of this paper (required)

1. The complexity of the multi-level analogy reasoning and meta-learning modules is high, and the prediction mechanism of the model needs to be clarified, especially for few-shot or bridging link prediction tasks.

2.The paper lacks an analysis of hyperparameter sensitivity, particularly the impact of different weights in the loss function.

3.The dataset used is artificially constructed by mixing closed links and bridging links. It is recommended that the authors test the model on a real-world DEKG dataset to evaluate its practicality.

4. The advantages of the DRG-GCN compared to traditional graph neural networks are not sufficiently demonstrated through experiments.

5.The problem definition section is brief; additional explanations could be added, potentially including the objective constraints and background information of the problem.

6. In Figure 1, the meaning of lines in different colors needs to be clarified, and there are too many entity images.

7. In Figure 2, the loss functions lack clear flow or connecting lines to indicate how they influence model training. The inputs and outputs of the multi-level analogy module are not explicitly shown.
12. Award Quality (only for papers marked "Definite accept")

0: Not award quality
13. Confidential Comments to technical program committee (will not be seen by authors):

The main contribution of the paper is the proposal of a meta-learning framework (Ank-motor) based on multi-level analogy reasoning and dynamic graph neural networks, designed to achieve inductive link prediction under few-shot conditions in disconnected knowledge graphs. Although there are areas for improvement, the paper provides sufficient data results, and the method demonstrates credibility.
